

M2 signal output terminals [, an expansion input terminal] and an expansion output terminal, [and] the second router module including a means for routing a signal received at any one of the N2 signal input terminals selectively to any one or more of the (M2+1) output terminals and for routing a signal received at the expansion input terminal selectively to any one or more of the M2 signal output terminals,

and wherein the expansion output terminal of the first router module is connected to the expansion input terminal of the second router module and the expansion output terminal of the second router module is connected to the expansion input terminal of the first router module.

12. (Amended) A routing switch comprising  $n$  routers ( $n > 1$ ) and wherein each router comprises  $p$  router modules ( $p \geq 1$ ) each having a plurality of signal input terminals, a plurality of signal output terminals,  $[n-1]$  (n-1) expansion input terminals and  $[n-1]$  (n-1) expansion output terminals and including a means for routing a signal received at any one of its signal input terminals to any one or more of its output terminals and for routing a signal received at any one of the expansion input terminals to any one or more of the signal output terminals, and an expansion interconnect network whereby each expansion output terminal of the  $i$ th router module ( $i = 1 \dots p$ ) of the  $j$ th router ( $j = 1 \dots n$ ) is connected to an expansion input terminal of the  $i$ th router module of a router other than the  $j$ th router.
